

Bring your ideas to apps without writing code

Features List

App Building

Quickly and easily create apps with intuitive drag-and-drop tool either from scratch or with the templates without writing a single line of code.

Fields

- Offers many different data types including Text, Number, Decimal, Currency, Date time, Checkbox , Picklist, Text area, URL, Lookup, Auto Number, Image, File, Text Editor, Email and Map
- Create conditional rules to generate default data
- Validate data with prebuilt properties including unique, required, length, etc.
- Display list items as color or icon
- Field level security based on the user roles *

Forms

- Intuitive drag-and-drop design environment using web browser
- Create forms that use information from fields
- Create the form layout with group of fields
- Create forms to capture or display information
- Control forms appearance based on the user roles
- Create public forms to capture information from external user *
- Create sub-forms to capture or display related information
- Create a responsive form to display devices
- Inline edit *
- HTML 5 & CSS3

Data

- Create expressions to transform data, selecting from available built-in function
- Use aggregation functions to summarize information
- Inline functions to provide complex logic and calculations
- Add custom validation patterns
- Import/export data in csv format
- Allow users to share data to other users with access level including read only, read/edit and full access
- Consolidate the records with data merging *
- Record recovery when deleted *

Data Relationship

- Bind relationship represents one-to-one relationship between the records
- Parent-Child relationship represents one-to-many relationship between the records
- Many-to-Many relationships *

Apps

- Combine the group of associated modules into apps
- Easily access with apps menu

View

Views give you a quick access to the records that meet your search criteria. You can set up filter criteria, select and order the fields to display, and share the view with other users.

Grid

- Create grid views to display information with built-in search and filtering
- Data can be searched on and filtered based on user-defined criteria
- Share view across user's role
- Auto refresh data within specific interval
- Create mobile views to display information in mobile app
- Intuitive drag-and-drop design environment using web browser
- Export view data into csv file*

Kanban

- Group record by status
- Change record status by drag and drop into another Kanban column
- Share view across user's role

Gallery

- Display record as gallery
- Share view across user's role

Timeline *

- Display record as timeline

Analytics

Monitor your business performance with ready-to-use reports and dashboards.

Report

- Create custom reports using intuitive drag-and-drop report designer
- Get real-time data in tabular, summary, matrix, chart and gauge format
- Drill down to get additional details *
- Multiple chart visualize including column, line, bar, pie, doughnut, funnel and pyramid
- Multiple gauge visualize including o-meter, donut, zones and cards single number
- Export report as PDF, Excel or text file.
- Scheduling Report *
- Share report across user's role *

Dashboard

- Create custom dashboard using intuitive drag-and-drop dashboard designer
- Common filter to search data with specified criteria
- Share dashboard across user's role *

Security

We value your privacy and strive to keep your information secure by taking extra precaution.

Role-base Access Controls

- Multi-level data access level including public, owner, hierarchy and organization
- Control information sharing and restriction based on a user role hierarchy
- Control information sharing and restriction based on an organization

Audit Trails

- Capture everything that occurs with your data
- Audit trail report
- Authenticate tracking

Password Policies

- Control password policy such as, expiration date, password reset and the limit of failed login attempts.
- Authenticate with Active Directory and Auth0

Workflow

Allow you to have greater control over your business processes with the configuration workflow.

Business logic

- Intuitive drag-and-drop design environment using web browser
- Create conditional rules to trig workflow process
- Triggered process based on record's events that occur when data changed including create, edit, delete, approve, reject, cancel and approving
- Schedule recurring processes by interval or daily
- Control execute condition by given order
- Start a workflow as part of another workflow
- Execute custom script when condition are met
- Create dynamic message using template
- Allow users to delegate approval tasks to other users

Approval

- Assign tasks to users or roles
- Approving by each or all
- Approval requests by email with configuration message like Yes, No or Y/N.

Action

- Create record based on conditional rules
- Update record based on conditional rules
- Set confirmation message base on conditional rules
- Conditional rule based to validate data
- Display error message to user for data correction
- Sharing record based on conditional rules
- Send the data to other systems via HTTP on conditional rules

Notification

- Send notification via email, SMS and in-app channel
- Support for multiples user including inline manager, team, record's owner

Process

Action

- Control basic function such as edit, delete and create
- Create custom action to execute script, open form
- Allow to define the function when the button is pressed
- Conditional rule based to display action

Screenflow

- Conditional rule based to create different field layouts based on entered values
- Conditional rule based to create steps for data entry

Scripting

- Formula expression to transform data, selecting from available built-in function
- Provide aggregation functions to summarize information
- Inline functions to provide complex logic and calculations

Personalize

- Customizable homepage with ready to use widgets including report viewer, chart viewer, gauge view and website view
- Personal view, report and dashboard
- Offers multiple themes support including classic and material
- Offers customizable date and number format
- Offers multiple language support

Integrations

Connecting to your cloud-based software or legacy systems with ease.

APIs

- Ready to use RESTful service
- Support formats such as XML and JSON

Email

- Integrate with SMTP to send email message
- Integrate with POP3 to retrieve message for approval

SMS

- Integrate with SMS API including Clickatell

3rd party Web Service

- Integration with Active Directory, Microsoft Excel, SAP*, NetSuite, Slack, Google Drive, Google Map, Magento, Intercom, Zendesk, Hubspot, Auth0 and Line@

Platform

Activity Management

- Allow you to manage the event and the task
- Display in various calendar views i.e., daily, weekly, monthly and team calendar
- Create company holiday and show in calendar

Document Management

- Keep document in the local storage or Google Drive

Form Designer

- Create custom document like invoice, quotation etc. using intuitive drag-and-drop document designer
- Export form as PDF, Excel or text file

Multi Language

- Provide multiple language support for users to choose for the profile according to their preference

Custom style and script

- Control appearance using your own custom stylesheet
- Client side validate using your own custom java script

Work across Multiple Devices

- Hybrid/Native* mobile app for iOS
- Hybrid/Native* mobile app for android

* Feature will be available in next release
